

AWS EC2 console instance running

1. Connecting to the Instance

Via AWS console/or SSH

if ssh

Giving Permission pem-key to be Used by ssh -i

```
chmod 400 ~/path/pem-key
```

Connecting to the Server

```
ssh -i ~/path/pem-key ubuntu@<your Public IP>
```

2. Installing the Web Server Stack

```
sudo apt update
```

```
sudo apt install -y apache2 php php-mysql php-mbstring mysql-server git
```

```
sudo systemctl enable apache2 mysql
```

3. Secure MySQL + create DB

```
sudo mysql_secure_installation
```

```
sudo mysql -u root -p
```

Inside MySQL prompt:

```
CREATE DATABASE your_db;
```

```
CREATE USER 'name_user'@'localhost' IDENTIFIED BY 'YourStrongPassword123!';
```

```
GRANT ALL PRIVILEGES ON your_db.* TO 'name_user'@'localhost';
```

```
FLUSH PRIVILEGES;
```

```
EXIT;
```

4. Deploy code

```
cd /var/www/html  
sudo rm -f index.html  
sudo git clone <github repository link>
```

5. Import schema

```
mysql -u hostel_user -p your_db < database/schema.sql
```

6. Set env vars (sudo nano /etc/apache2/envvars, add at bottom):

```
export DB_HOST="localhost"  
export DB_NAME="your_db"  
export DB_USER="name_user"  
export DB_PASS="YourStrongPassword123!"
```

Then sudo nano /etc/apache2/apache2.conf, add:

```
PassEnv DB_HOST DB_NAME DB_USER DB_PASS
```

```
sudo systemctl restart apache2
```

7. Fix permissions

```
sudo chown -R www-data:www-data /var/www/html
```
